

INSENS

 | The new shower generation

SUSTAINABLE

70% water saving for every shower

- Immediate temperature adjustment on start-up without wasting water

- 50% lower energy requirements for domestic hot water production

DIGITALE

10 customizable user profiles

- Mobile application

- Digital control with color LCD interface

SENSORY

Hot water from the very first drop

- Temperature accuracy to the nearest half degree

- Shower programs Relaxation & Vitality*

WATER SAVING

70% water saving for each shower.

ENERGY SAVING

50% less energy used to produce hot water.

INSENS

A unique experience !

To avoid wasting water, the INSENS ecological shower stores the water at start-up until it reaches the chosen temperature. So you get hot water from the very first drop. It releases this water as the shower progresses, maintaining the set temperature so that not a drop is wasted.

The flow rates adapt automatically to your usage thanks to an intelligent sensor that reduces or cuts off the jet when you move away from it to lather up.

From its digital control interface, fully functional in wet areas, the user can control all the functions of the InSens shower and can obtain the desired temperature and flow rate of the shower water to be achieved with the very first drops of water after starting the shower.

INSENS can be programmed and controlled via a special mobile application that allows you to change the personalised settings of 10 different users via your smartphone and save them directly on the control interface.

INSENS' intelligent control technology ensures flow control, temperature regulation and stability, as well as flow moderation, whatever the installation conditions.

The hydrobox (the system's hydraulic box) takes up very little space and can be installed in the shower area, but can also be installed in a false ceiling, under the bath or in a suitable piece of furniture.
